

Technical Point

“Tribrid System” – A futureproof combination of Turbo HD, Analog and IP

Based on HDTV (High Definition Transport Video Interface) technology, Hikvision has developed the revolutionary Turbo HD Analog solution. This solution enables reliable long-distance analog HD video transmission over coaxial cable. Convenient and easy-to-use, the Turbo HD Analog solution is installed via the same means as conventional analog solutions.

Hikvision’s Turbo HD DVR offers simultaneous network, analog and Turbo HD camera connections, automatically detecting incoming signals for recording. This means that existing systems can be upgraded simply by replacing current cameras and DVRs, covering new areas by adding IP network cameras.

Turbo HD DVRs support standard definition cameras, network cameras and Turbo HD cameras, helping to minimize system budgets by upgrading some of the existing analog cameras to the enhanced functionality of Turbo HD while still using the remainder for more basic applications.
